

March 2011, All models are wrong

# Models in Material Physics

## Two cases without error bars

Sylvia Wenmackers, Danny E.P. Vanpoucke  
s.wenmackers@rug.nl

# Structure of talk

## Scientific models

Concepts from philosophy of science

### Case 1

Ellipsometry of DNA on diamond

### Case 2

STM of nanowires on Ge(001)

# Philosophy of scientific models

## Semantics of models

What do models represent?

## Epistemology of models

How can we learn from models?

## Ontology of models

What are models?

### Statistics

- Mathematical models
- Models of data

### Material physics

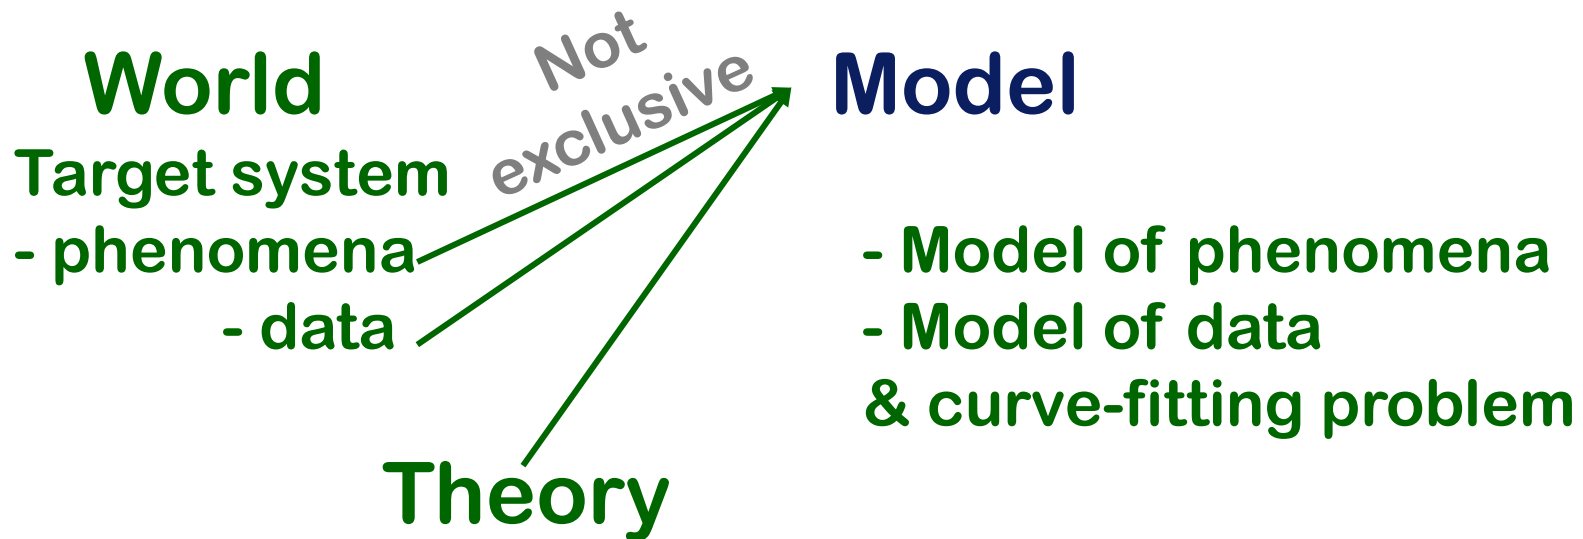

- Material sample

Frigg&Hartmann in: Sarkar&Pfeifer *Phil of Sci: Encycl.* (2005)

# Philosophy of scientific models

## What do models represent?

# Philosophy of scientific models

## How can we learn from models?

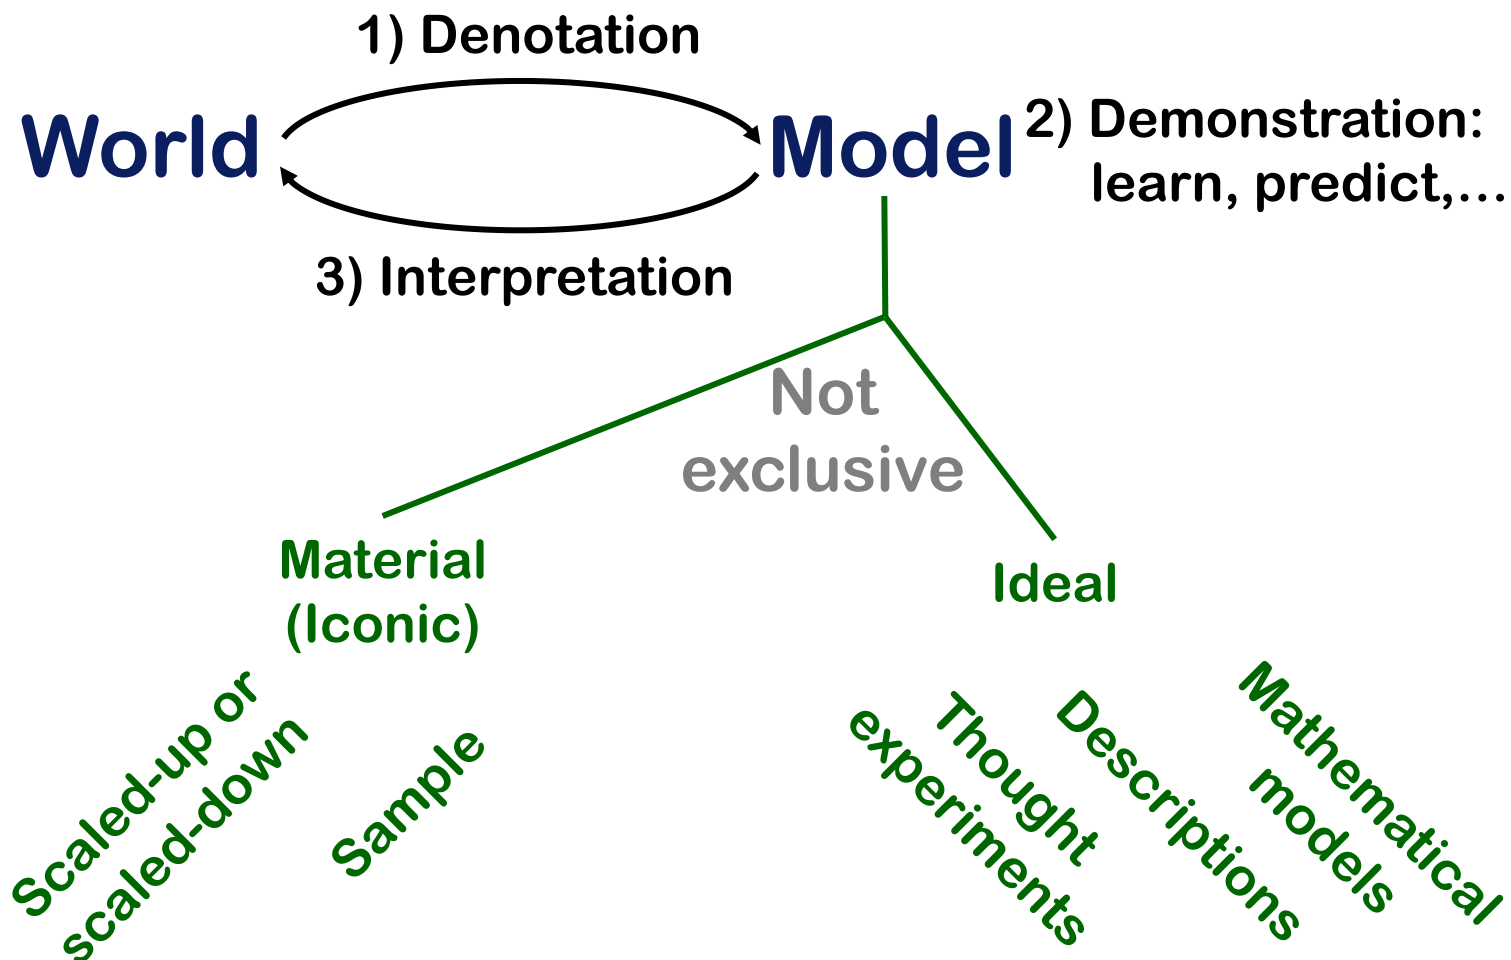

Learning via model happens in 3 steps

# Philosophy of scientific models

## What are models?

Frigg&Hartmann in: Sarkar&Pfeifer *Phil of Sci: Encycl.* (2005)

# Ellipsometry of DNA on diamond

Introduction of case  
research question, method, and result

How reliable is the result?

Analyze experiment & calculation

- Complex process
- Different types of theories & models
- Possibility of errors at each stage

Conclusion

# Ellipsometry of DNA on diamond

universiteit  
hasselt

INSTITUUT VOOR  
MATERIAALONDERZOEK

Research question:

**Angle between DNA and diamond?**

# Ellipsometry of DNA on diamond

## Spectroscopic ellipsometry (UV-Vis)

**Bases:**

**$\pi - \pi^*$  transition  
bonding – anti-bonding**

# Ellipsometry of DNA on diamond

**Model:**

**Optical model (three layers)**

# Ellipsometry of DNA on diamond

**Result:**

**Angle between DNA and diamond**

**How reliable is the result?**

# Ellipsometry of DNA on diamond

Traditional view on models:

Model describes a target system  
part of reality

Our target system

= diamond-based DNA sensor

⇒ something that doesn't exist (yet)

In material physics & engineering,  
target system may be an **ideal model**.

# Ellipsometry of DNA on diamond

Sample = **material model**,  
**iconic model**

represents surface of typical diamond DNA sensor

Protocol  **ideal model of**  
Execution of protocol

Nanoscience: result not directly observable

**Additional characterization methods**

On actual sample or parallel sample?

**Main characterization method**

# Ellipsometry of DNA on diamond

**Main characterization method**

**In casu, UV-Vis ellipsometry**

Complex apparatus connected to synchrotron

**Raw data**

Selection of 'good' spectra

**Clean data = model of the actual data**

# Ellipsometry of DNA on diamond

## Information on experimental method

physical theory (optics), design of apparatus

## + Information on sample

protocol, outcome of additional tests

## ⇒ Mathematical model

- Additional parameters: only if theory gives them physical interpretation
- Involves idealizations (flat layers) and other approximations

## Different representations

Müller matrices,  
schematic drawing

# Ellipsometry of DNA on diamond

**Simulate spectra based on the mathematical model & fit to clean data**

**Determine  $\alpha$  from values of best fit**

# Conclusions Case 1

☹ Result is very likely to be wrong

*cf.* Ioannidis PLoS 2005

😊 Experiment was repeated: same  $\alpha$

At least, method is robust  $\Rightarrow$

can be used to compare sample parameters

Observe:

Even if we had computed error on  $\alpha$ ,  
it would only inform us of error in fit  
= very last step in chain

## Case 2

# STM of nanowires on Ge(001)

Introduction of case  
research question, method, and result

How reliable is the result?

Analyze experiment & calculation

- Complex process
- Different types of theories & models
- Possibility of errors at each stage

Conclusion

# STM of nanowires on Ge(001)

Pt-induced nanowires on Ge(001)  
observed by STM

Research question:

Nature of the wires (Pt, Ge, ...)?

# STM of nanowires on Ge(001)

Measurement technique:

**Scanning Tunneling Microscopy (STM)**

# STM of nanowires on Ge(001)

Model:

## Atomistic model

- Pt atoms
- Ge atoms
- Pt or Ge dimer

# STM of nanowires on Ge(001)

**Result:**

**The nanowires are made of Ge**

**How reliable is the result?**

# STM of nanowires on Ge(001)

Information on experimental method

quantum mechanics (QM), how STM works

+ Information on **sample**

Protocol (% Pt), preliminary tests

⇒ **Atomistic model**

Involves approximations

- approx. QM to density function theory (DFT)
- isosurface of charge density = tunneling
- periodic boundary conditions ( $\infty$  area)
- 0K, 0Pa, STM-tip = point source

Different representations

list of coordinates,  
schematic drawing

# STM of nanowires on Ge(001)

**Simulated STM images** based on various atomistic models.

Compare to experimental images.

Refine atomistic models (combine structures).

**No actual fitting occurs:**

*ab initio (from theory)*

Identify best match: underlying model structure of this best-match is taken to be actual structure of the sample

# Conclusions Case 2

Strong point of this case:

*ab initio*, no statistical fitting

The result may still be wrong, *e.g.* if:

- all atomistic models were wrong
  - contamination of sample,
  - different % Pt in actual sample,
  - just not thought of relevant configuration
- some approx. was unwarranted

**Atomistic realism:**

It is assumed that the atoms are spatially arranged in a specific way = right model

I. \_\_\_\_\_  
A. \_\_\_\_\_  
B. \_\_\_\_\_  
II. \_\_\_\_\_  
A. \_\_\_\_\_  
B. \_\_\_\_\_

# General conclusions

In material science, error bars may provide a false feeling of security

Material scientists tend to be realists about their **models**

# parameters is chosen on the basis of **background theory** + contextual info rather than some information criterion

# Thank you for your attention
